FEA

Yewon Jang

Model

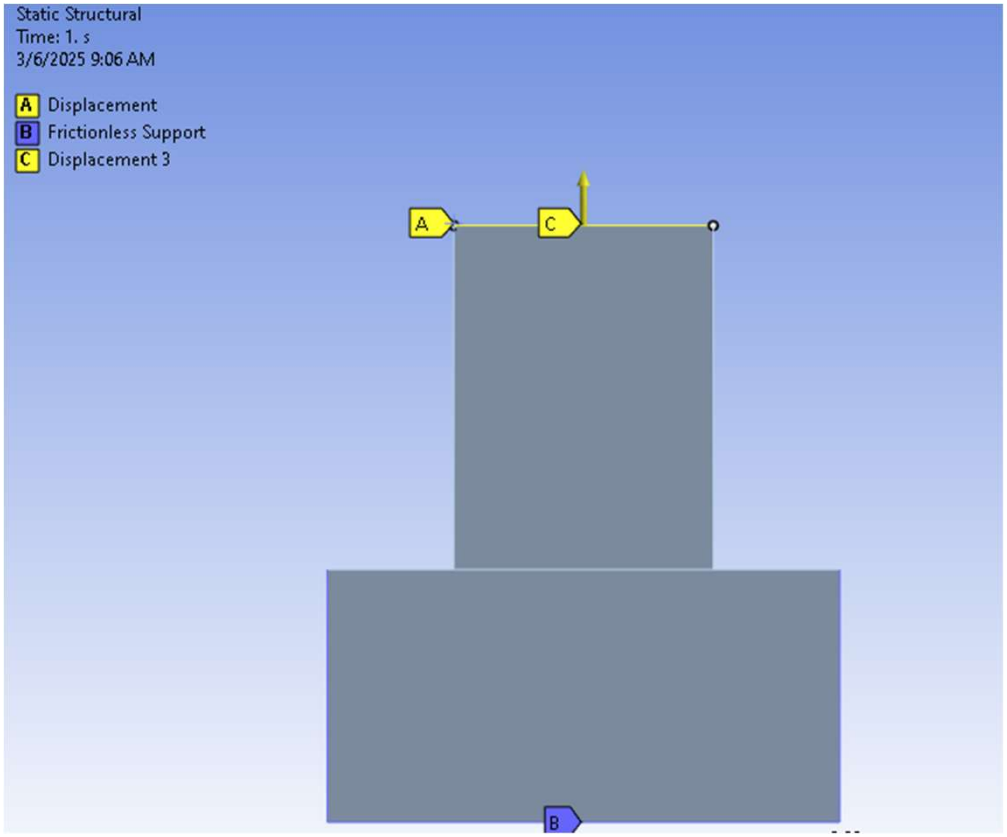

The upper rectangular

-> the skin used in surgery

The lower rectangular

-> the skin on the surface of the hand

Boundary conditions of model

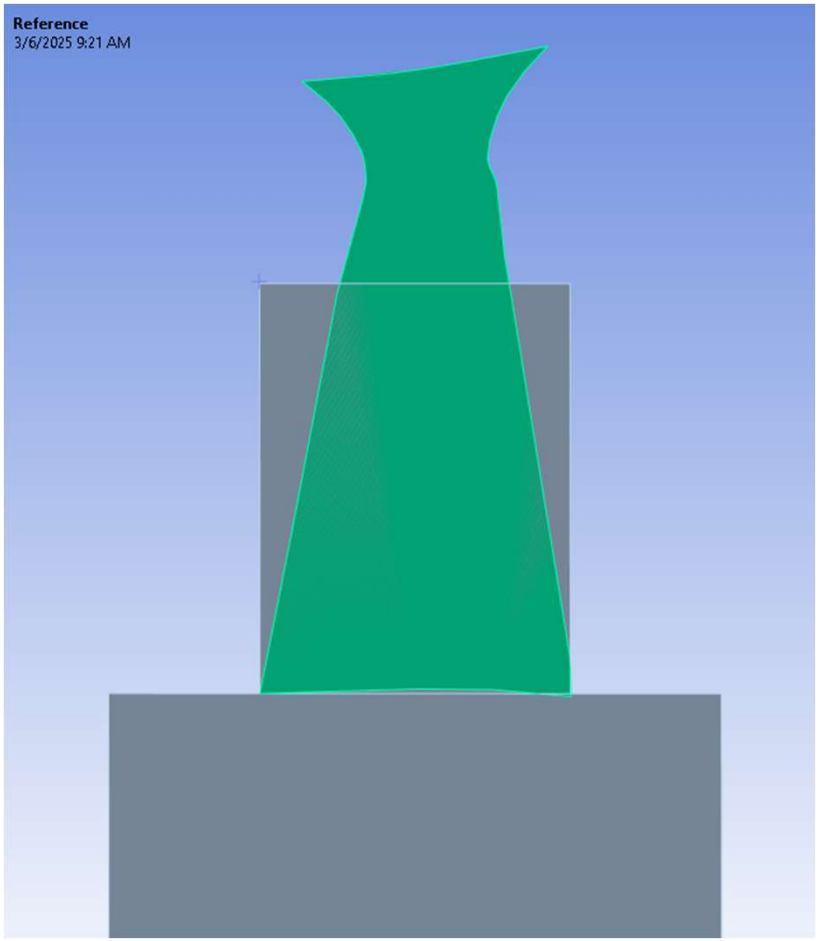

A: Moves the skin to the target position

C: Ensures the x-coordination of two nodes remain fixed

B: Represents the boundary conditions of the hand surface skin as a frictionless support

How to get the target position

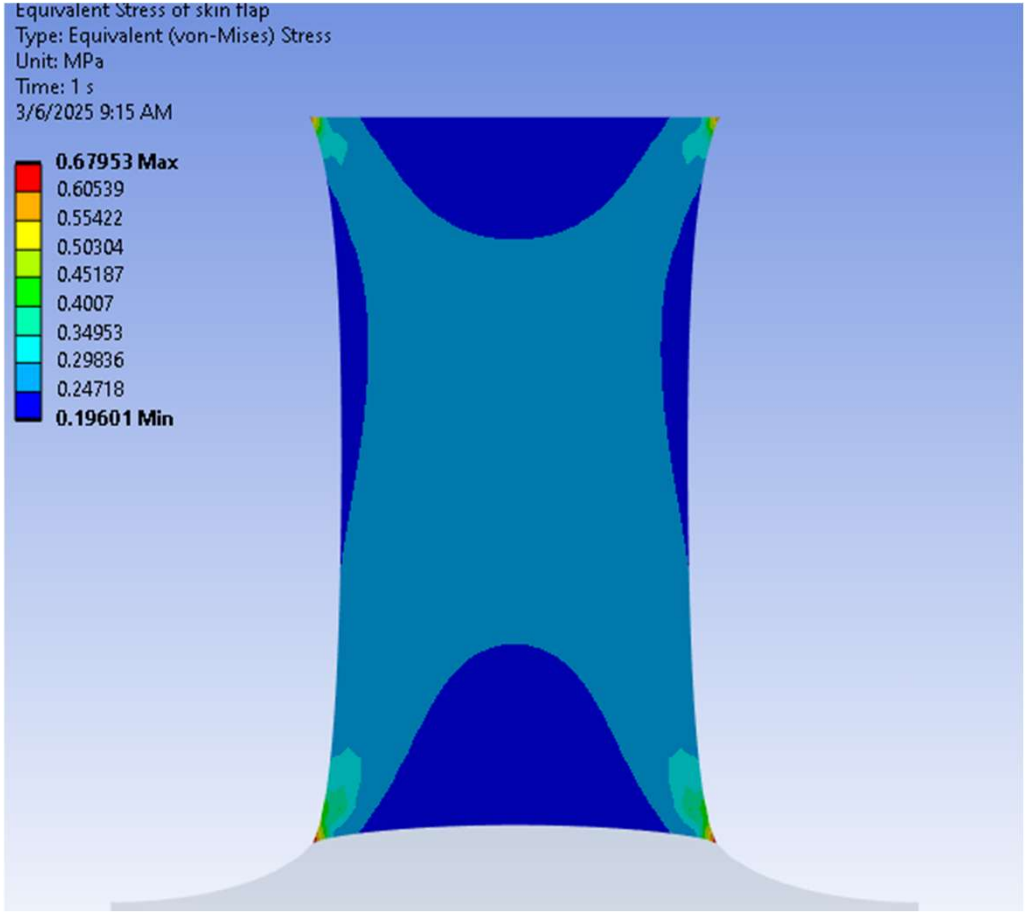

The green model is an unrolled representation of the surgical skin area extracted from the surface of the hand model

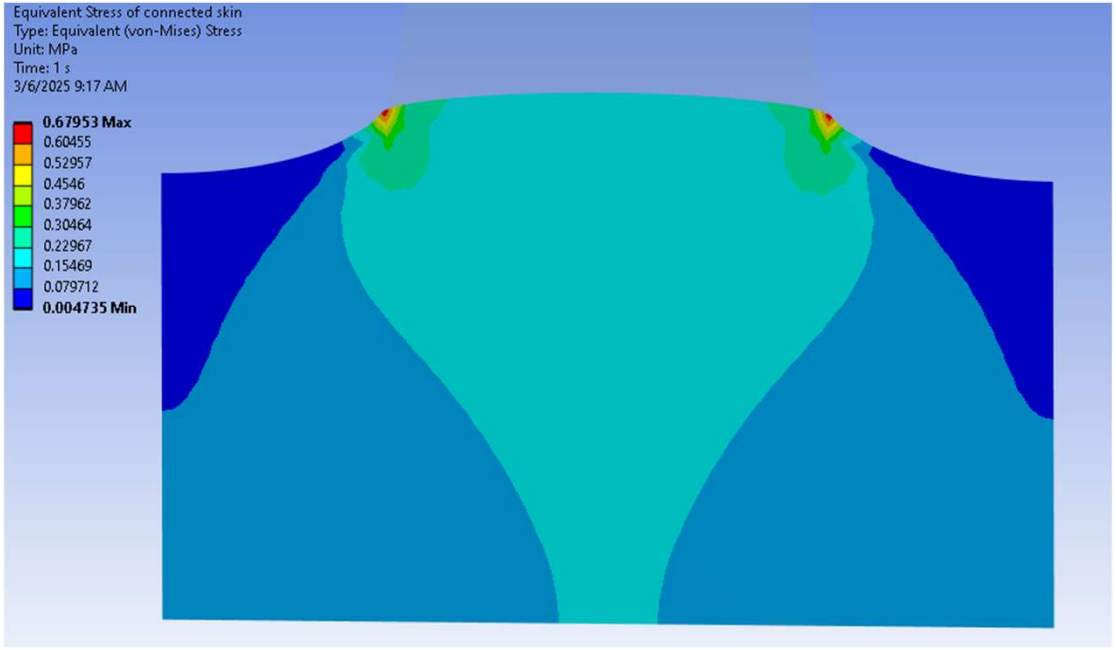

-> Measure the distance between the green model and the rectangular model

-> Target Position

Equivalent Stress of Upper Skin

Equivalent Stress of Lower Skin

Equivalent Stress of All Bodies
